Bulletin No. CLXVI

## PART I

### *Summary of Prominence and Calcium Flocculus Observations for the First Half of 1961*

The results of observations of prominences and calcium flocculi made at Kodaikanal Observatory during the first half of 1961 supplemented by data derived from photographs supplied by Mount Wilson and Meudon Observatories for those days on which Kodaikanal had imperfect or no observations due to cloudy sky conditions are summarised in Part I of this Bulletin. Our thanks are due to the co-operating observatories for the photographs supplied by them.

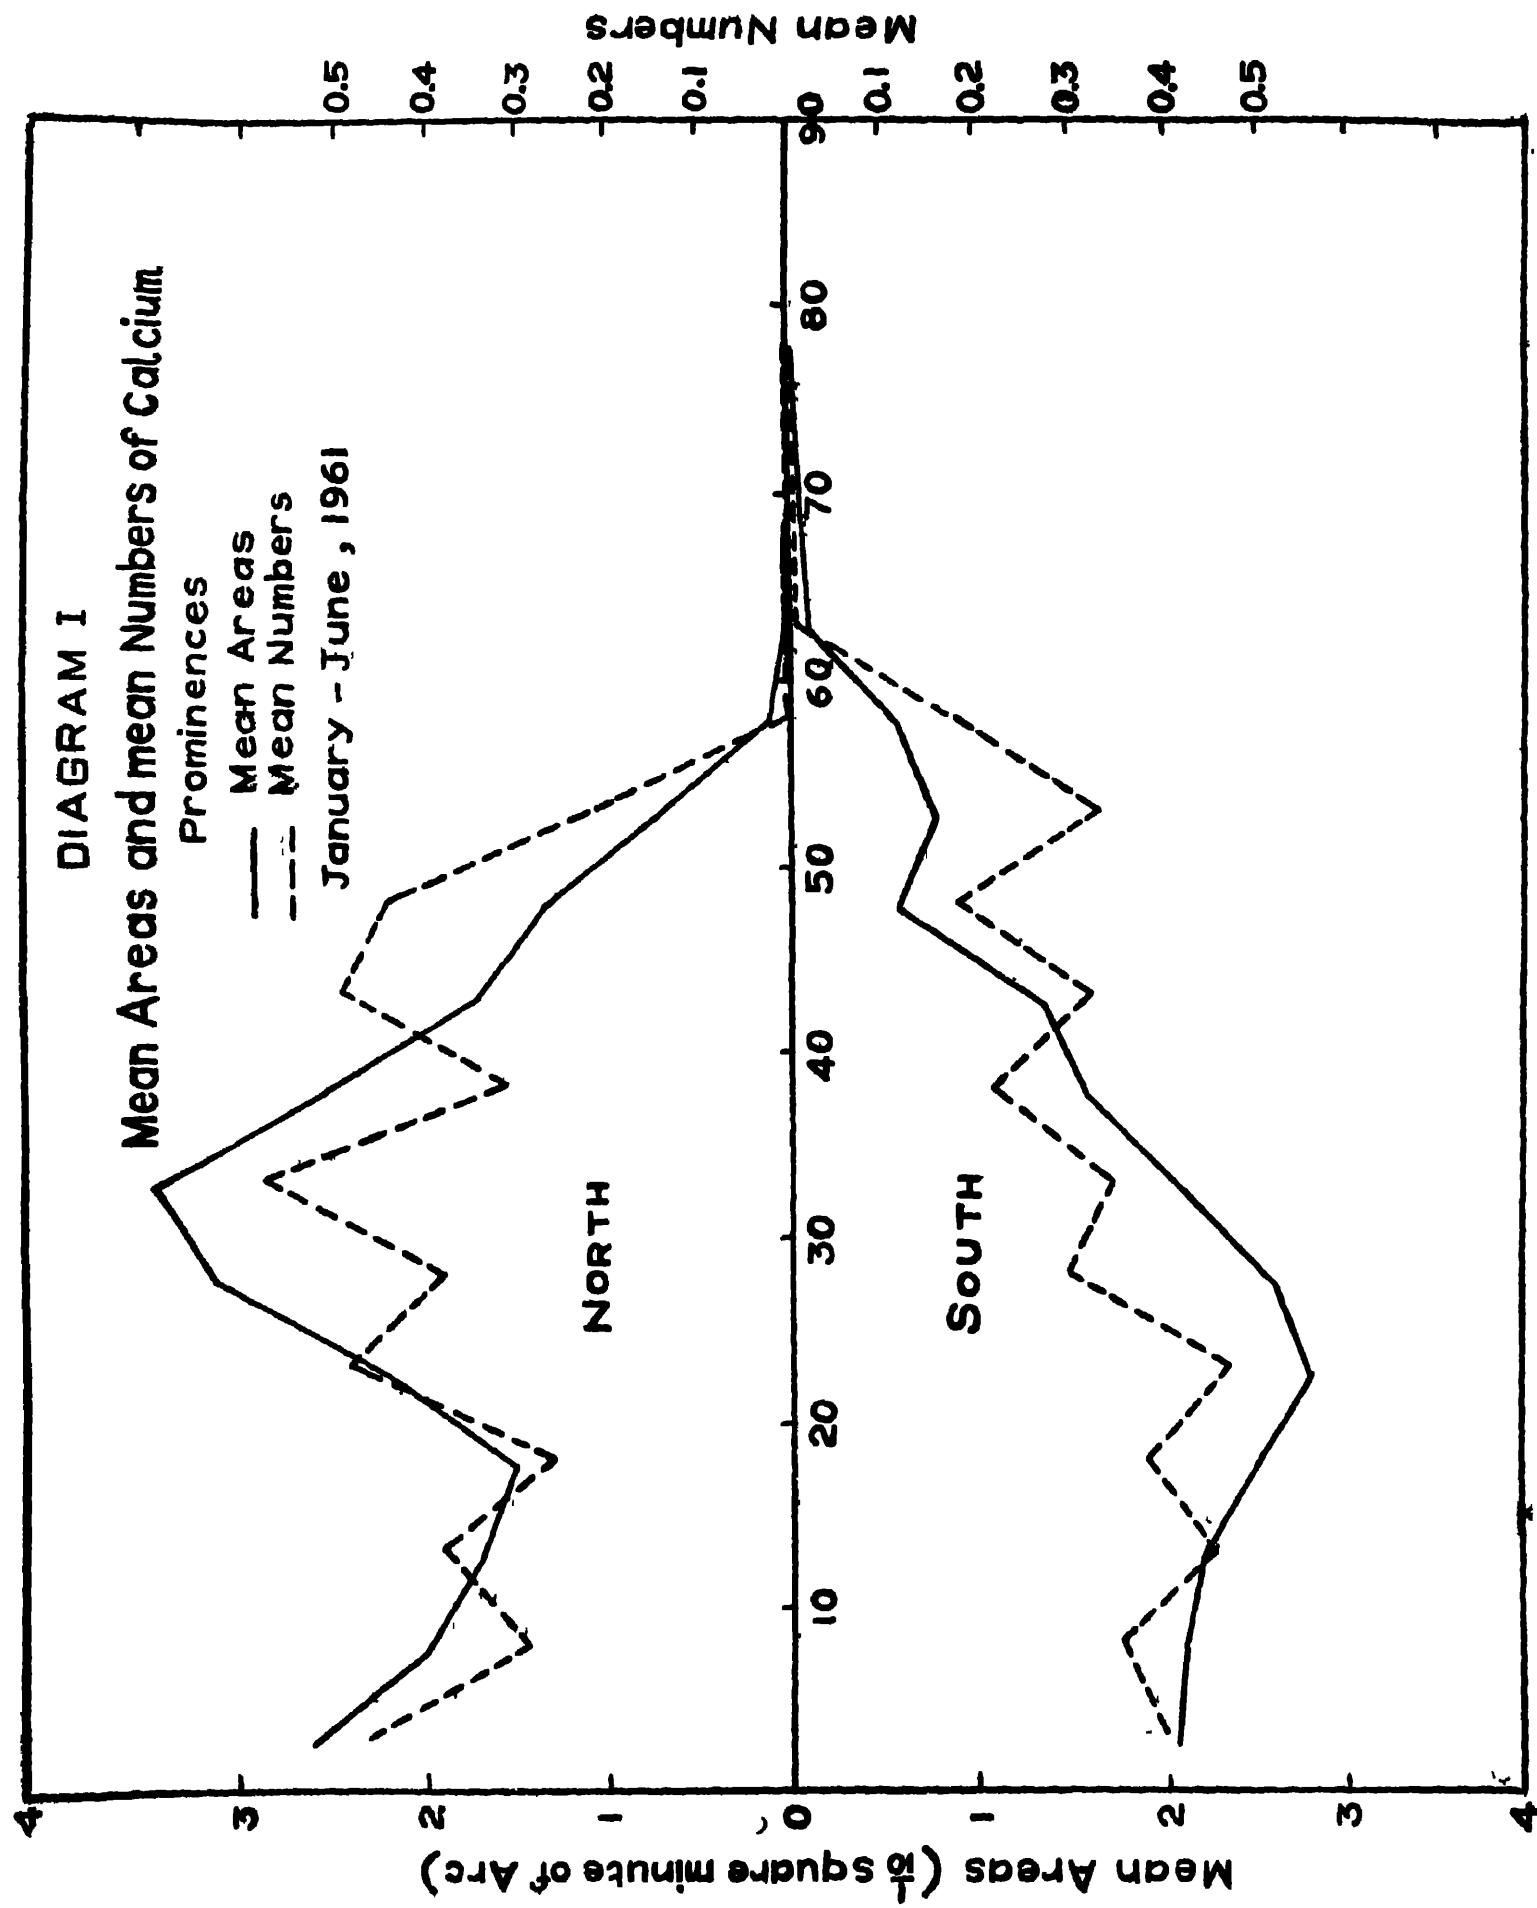

*Calcium prominences on the limb.*—During the half-year under review, photographs of calcium prominences were secured at Kodaikanal on 129 days which were counted as  $107\frac{1}{2}$  effective days after giving due weightage according to their quality. Spectrohelio-grams for 32 days were obtained from the Mount Wilson Observatory and for 36 days from the Meudon Observatory. In all complete observations were available for  $143\frac{1}{2}$  effective days.

The mean daily areas (in square minutes of arc) and the mean daily numbers of prominences derived from all the above records are as follows :—

Combined data			
	Mean daily areas	Mean daily numbers	
North . . . . .	2.29	4.3	
South . . . . .	2.14	4.0	

These figures, when compared with the corresponding values of the previous half year, indicate a decrease of 7.9% in areas and 5.3% in numbers.

The distribution of areas and numbers in five degree ranges of latitude as obtained from the combined data is represented in diagram I. In the curves for area, there is a broad peak of activity in the northern hemisphere in the latitude belt  $25^{\circ}$ - $35^{\circ}$  while in the southern hemisphere the maximum activity is in the zone  $20^{\circ}$ - $30^{\circ}$ . In the curves for numbers, the peak of activity in the northern hemisphere is in the latitude belt  $30^{\circ}$ - $35^{\circ}$ .

The monthly, quarterly and half-yearly areas, numbers, heights and extents of prominences derived from all the photographs are given in table I

The distribution of prominences about the sun's axis of rotation is as follows :—

#### *Observations with the Hale Spectrohelioscope*

Details of Doppler displacements in prominences and dark markings observed in the light of the H-alpha line are given in table II.

*Prominences projected on the disc as absorption markings*

During the period under review photographs of the sun's disc in H-alpha line were obtained at Kodaikanal on 129 days which were counted as  $99\frac{1}{2}$  effective days after giving due weightage according to their quality. Spectroheliograms for 31 days were received from the Mount Wilson Observatory and for 37 days from the Meudon Observatory. On the whole, records were available for  $140\frac{1}{2}$  effective days.

The mean daily areas in millionths of the sun's visible hemisphere (uncorrected for foreshortening) and the mean daily numbers of the H-alpha dark markings as derived from the combined data are given below :—

Combined data		
	Mean daily area (Millionths of the sun's visible hemis- phere)	Mean daily numbers
North	1859	11.0
South	1925	8.6
Total	3184	19.6

Compared to the previous half-year, there has been an appreciable decrease in the activity, the decrease being 40.3% in areas and 38.6% in numbers.

The distribution of the areas of the absorption markings in  $5^{\circ}$  ranges of latitude as obtained from the combined data is shown in the diagram II. The peak of activity in the northern hemisphere is in the latitude belt  $25-35^{\circ}$ .

The distribution of total areas and numbers of the dark markings east and west of the sun's axis of rotation is as follows :—

	East	West	Percentage East
Total area (in millionths of the sun's visible hemisphere uncor- rected for foreshortening)	2,134.38	2,388.13	47.2
Total numbers	1,363	1,397	49.4

Particulars of solar flares, sudden disappearances of prominences and dark markings, surges and active prominences are given in tables III-V. The hours of solar patrol with the spectrohelioscope and the Lyot monochromatic heliograph are shown in the accompanying charts.

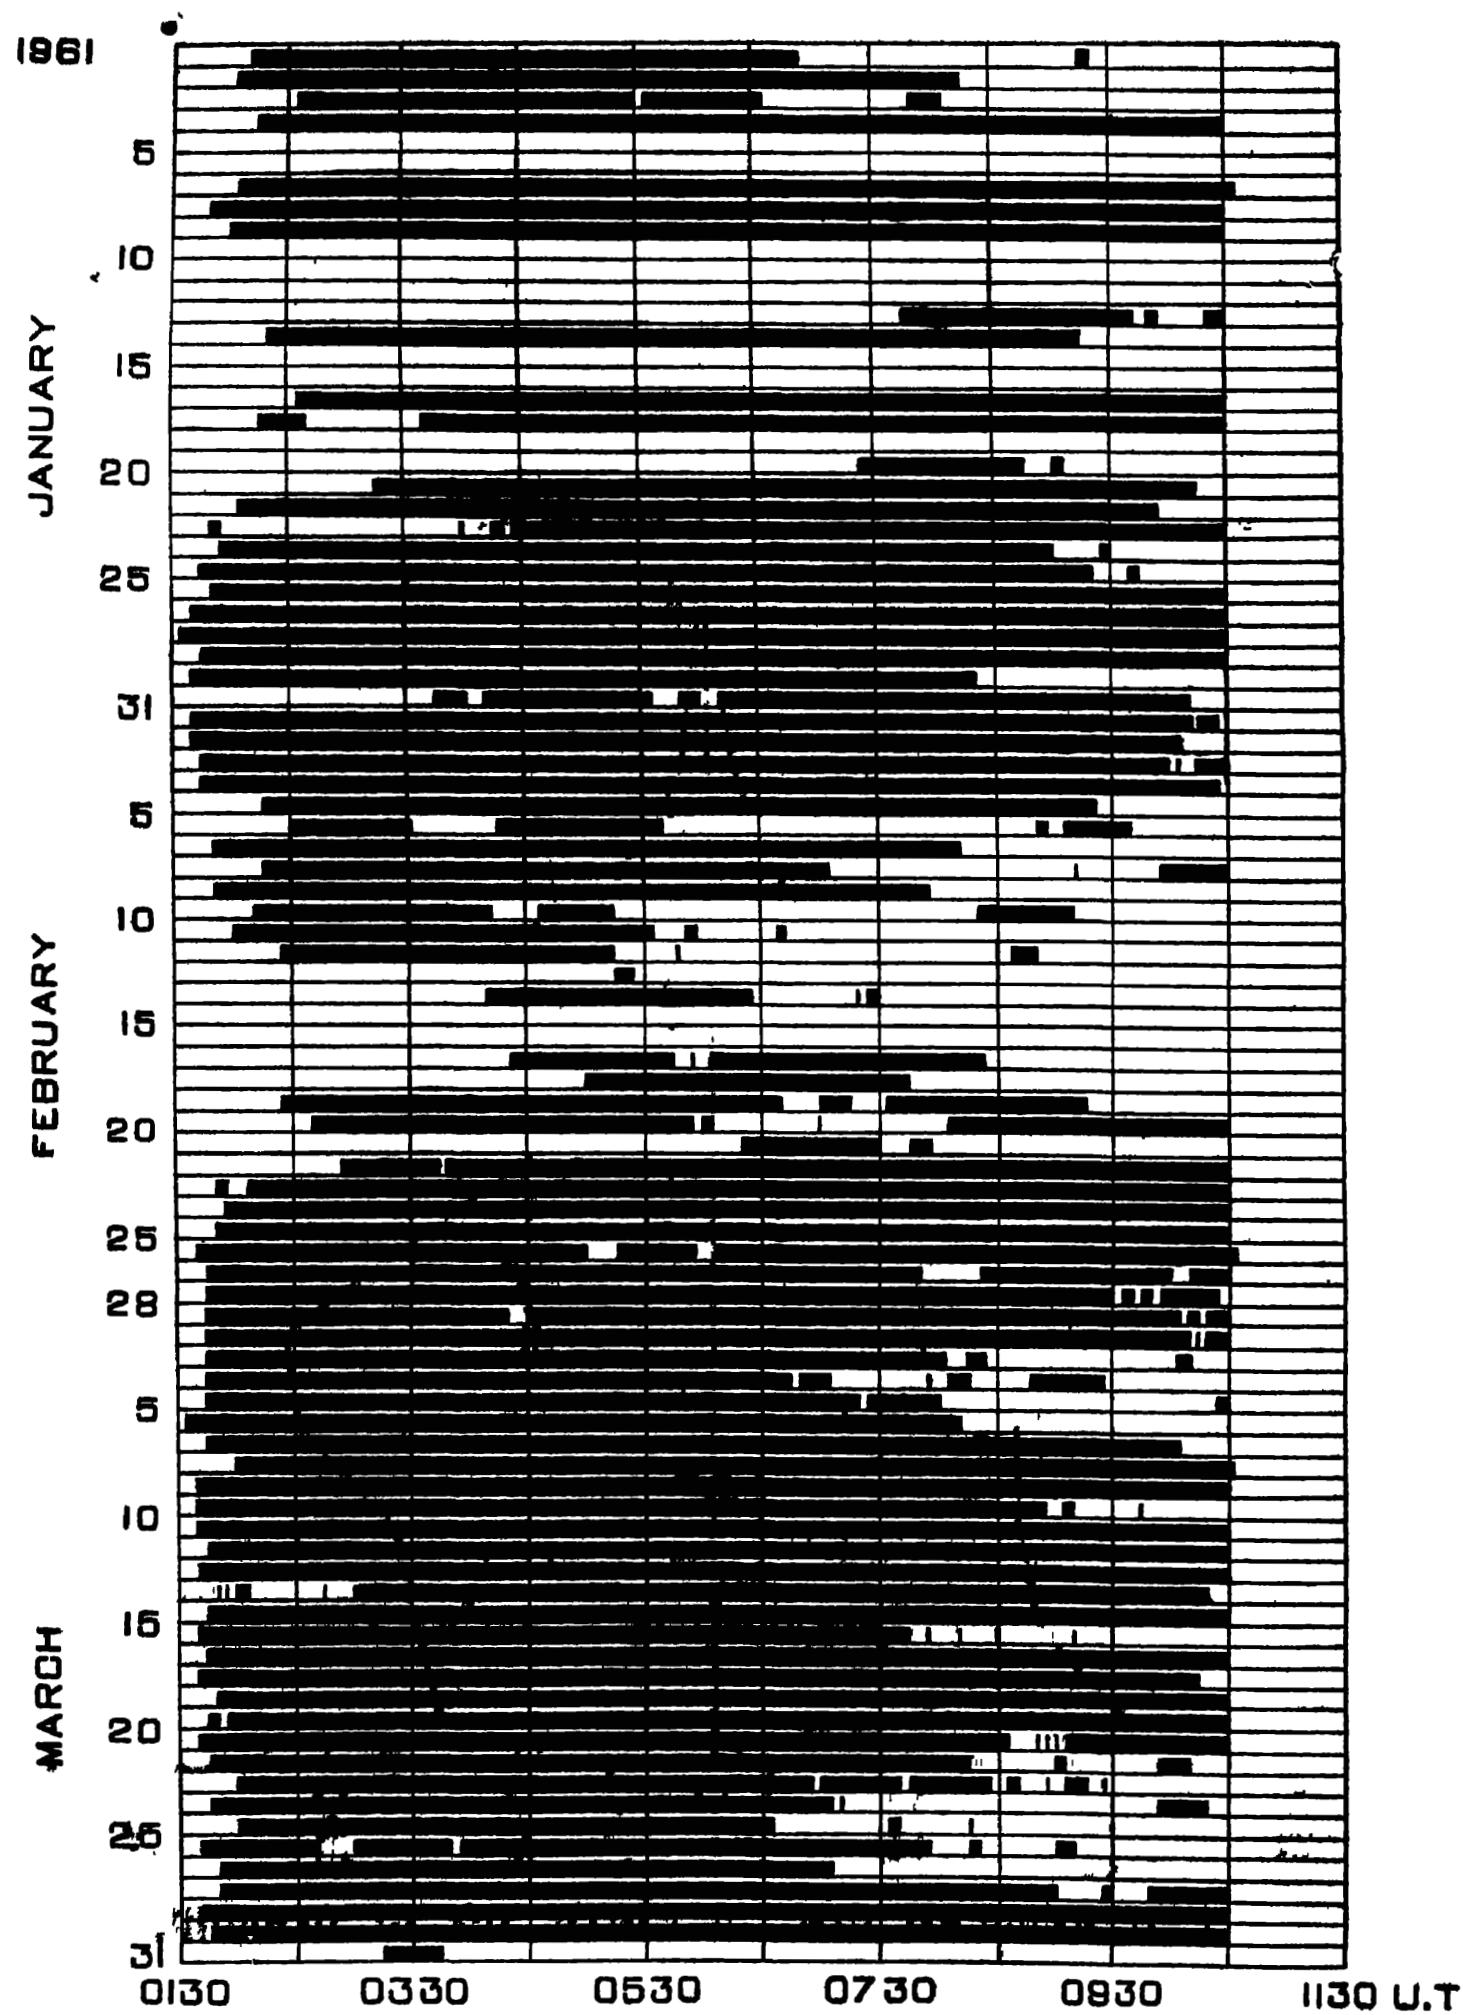

*Calcium flocculus*

During the period under review, calcium flocculus spectroheliograms were taken on 150 days at Kodaikanal. Calcium disc spectroheliograms for 18 days were received from the Mount Wilson Observatory and for 26 days from the Meudon Observatory. In all complete observations were available for  $149\frac{1}{2}$  effective days.

## PART II

*Magnetic observations for the first half of 1961*

Brief description of the absolute instruments, the variometers and the system of observations are available in Bulletins Nos CXXXII and CXXVI of this observatory. The data given in this Bulletin are derived mainly from the records of LaCour instruments, but in case of failure of LaCour records, Watson magnetograms have been used.

The adopted values of the scale coefficients for the horizontal force were  $29\gamma/\text{cm}$  during the first quarter and  $28\gamma/\text{cm}$  during the second quarter of 1961. The scale coefficients for the vertical force were  $120\gamma/\text{cm}$  during the first quarter and  $115\gamma/\text{cm}$  during the second quarter of 1961. The scale coefficient for the declination was  $14'/\text{cm}$  for the first half of 1961.

## PART III

*Ionospheric Observations for the first half of 1961*

A description of the system of ionospheric observations at Kodaikanal with a brief description of the Ionosphere Recorder has been given in Bulletin No 146 of this observatory. The present Bulletin contains half-hourly values of eleven ionospheric parameters viz.,  $\text{foF}_2$ ,  $\text{foF}_1$ ,  $\text{foE}$ ,  $\text{foEs}$ ,  $\text{fbEs}$ ,  $f_{\min}$ ,  $\text{h}'\text{F}_2$ ,  $\text{h}'\text{F}_1$ ,  $\text{h}'\text{E}$ ,  $\text{h}'\text{Es}$  and ( $M_{3000}$ )  $\text{F}_2$  with symbols and terminology as recommended by the Special Committee on World-wide Ionospheric Soundings to the URSI/AGI in its First Report (Brussels, September 2, 1956).

The following symbols and conventions have been used according to recognised practice

- (i) Approximate time of ending of storm construed as the time of cessation of reasonably marked disturbance movements in the trace.
- (ii) S C.—Sudden Commencement ( )—Gradual commencement
- (iii) Signs of amplitudes of 'D' and 'Z' taken algebraically, (D=reckoned negative being westerly)  
(Z=reckoned positive being vertically downwards)
- (iv) Storm described by three degrees of activity      m)—for moderate (when range is less than 250 r)  
(ms)—for moderately severe (when range is between 251r and 400r)  
(s)—for severe (when range is above 400r)
