## KODAIKANAL OBSERVATORY

Bulletin No CLXVII

Published on

### PART I

#### *Summary of prominence and calcium flocculus observations for the second half of 1961*

The results of observations of prominences and calcium flocculi made at Kodaikanal Observatory during the second half of 1961, supplemented by data derived from photographs supplied by the Mount Wilson and Meudon Observatories for those days on which Kodaikanal had imperfect or no observations due to cloudy sky conditions are summarised in Part I of this Bulletin. Our thanks are due to the co-operating observatories for the photographs supplied by them.

#### *Calcium Prominences on the limb*

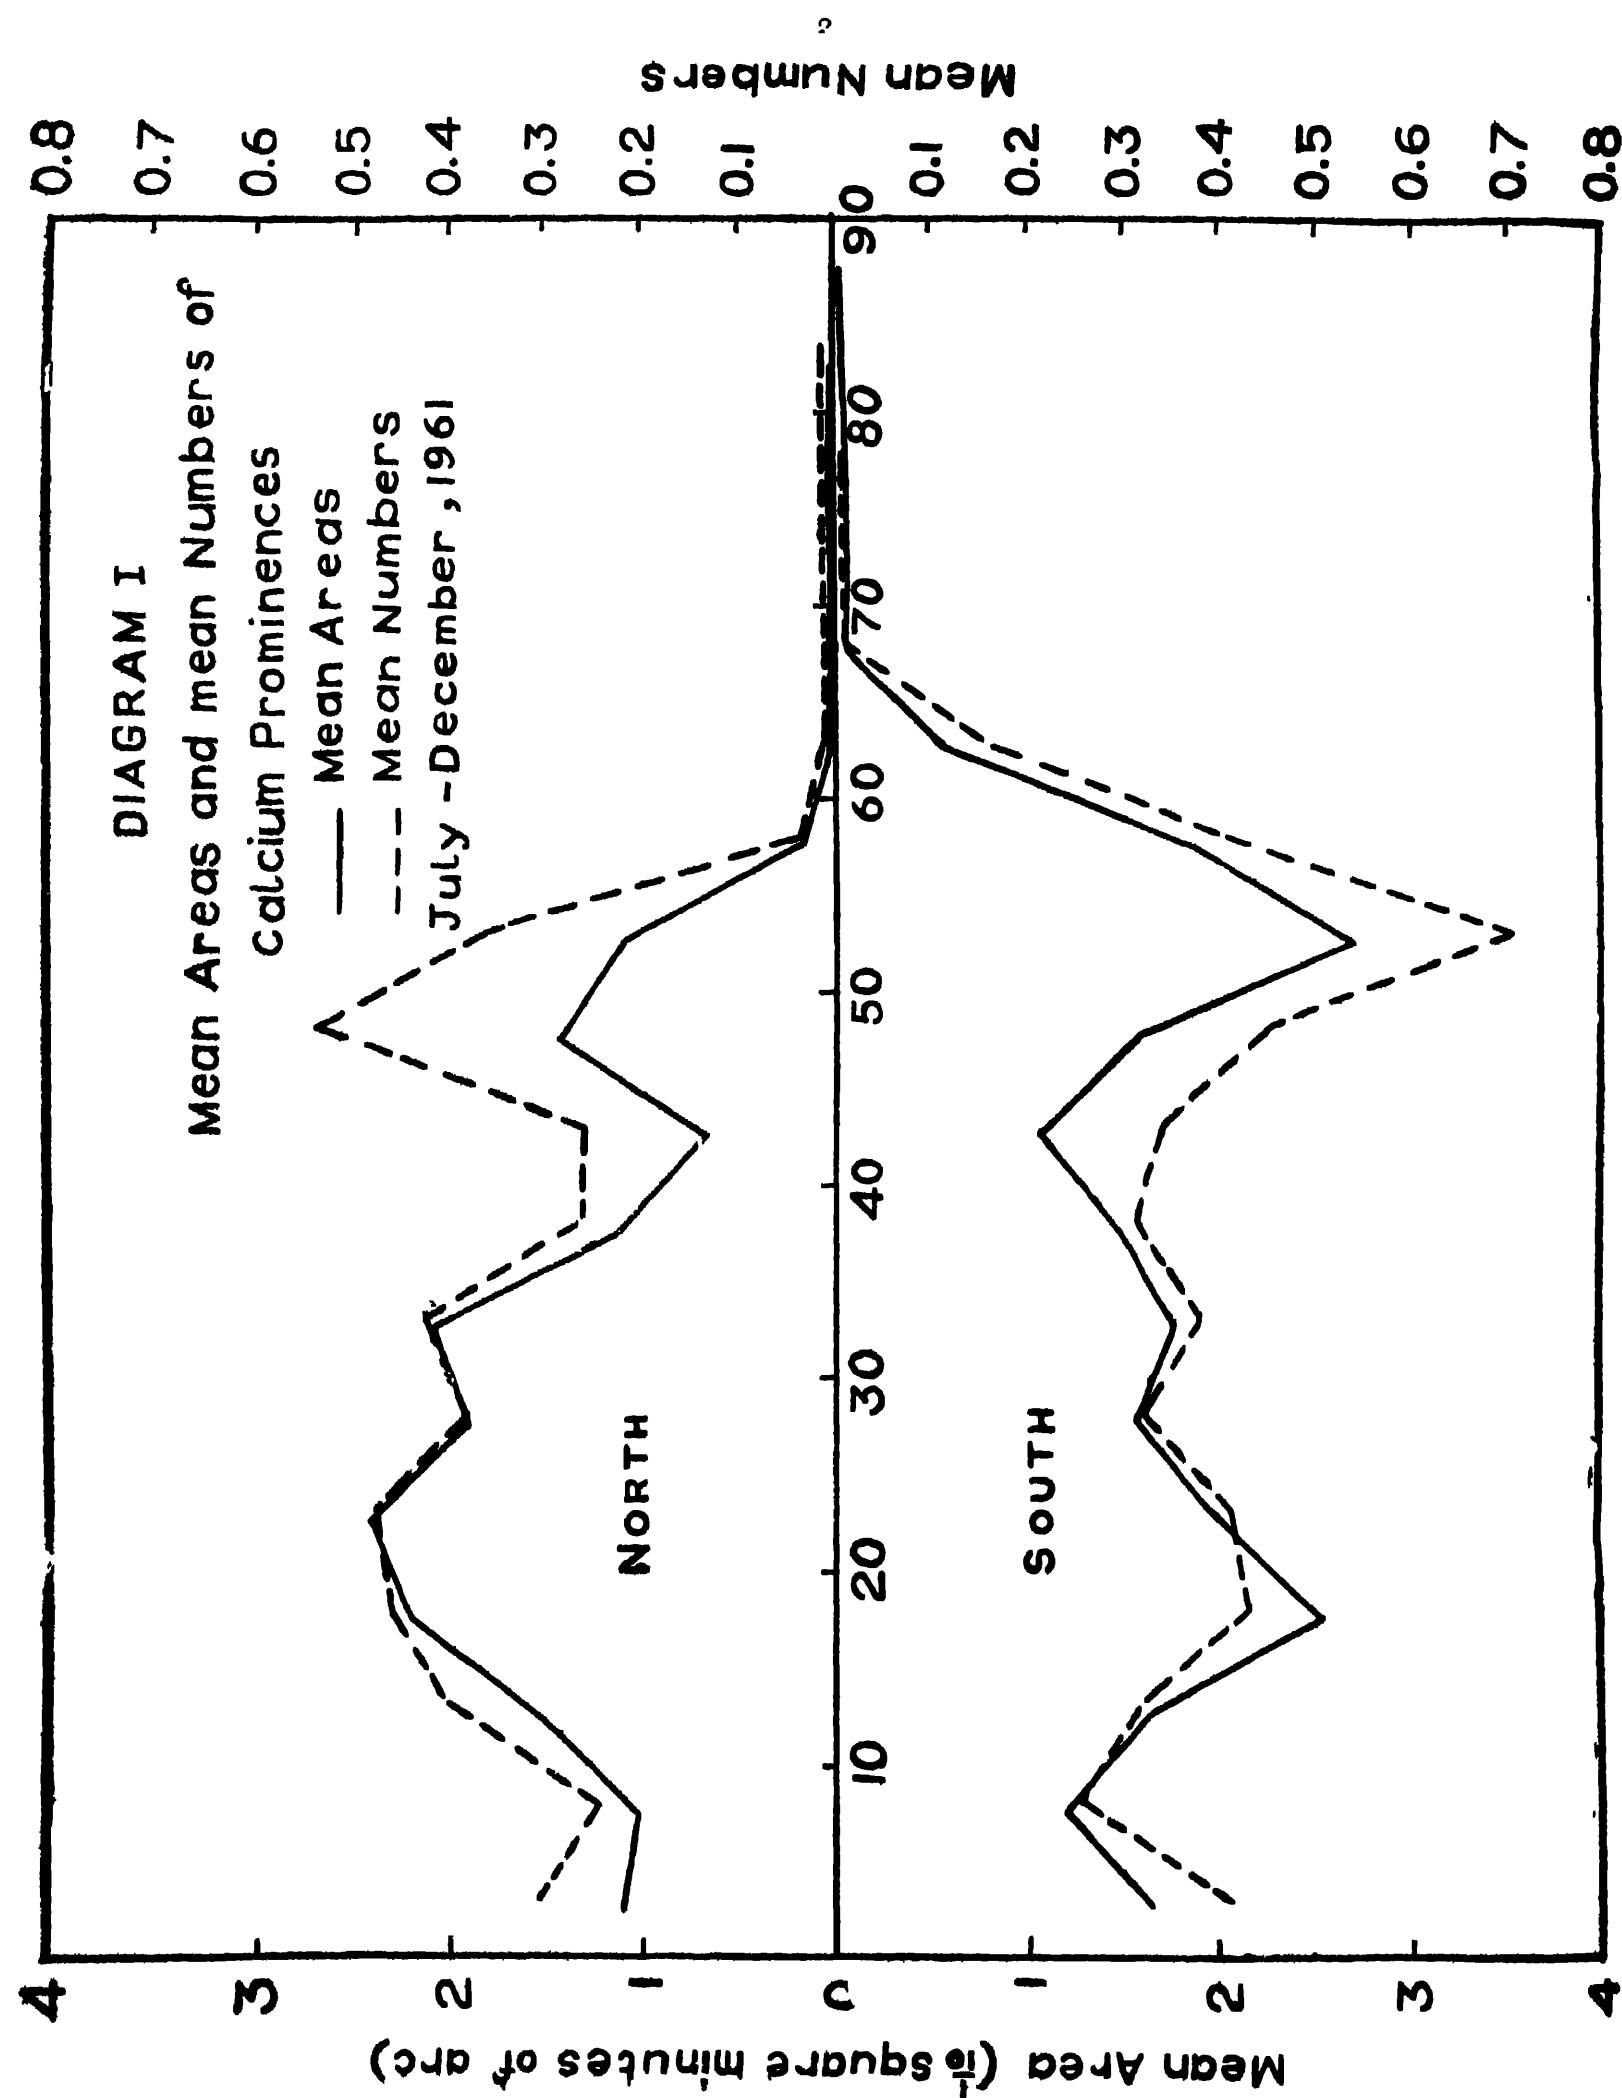

During the half-year under review photographs of calcium prominences were secured at Kodaikanal on 113 days. Spectroheliograms for 43 days were received from the Meudon Observatory and for 10 days from the Mount Wilson Observatory. In all, observations were available for 129 effective days after giving due weightage to the quality of the photographs.

The mean daily areas (in square minutes of arc) and the mean daily numbers of prominences derived from all the above records are as follows

	Combined data	
	Mean daily areas	Mean daily numbers
North	1.69	4.25
South	2.17	4.93
TOTAL	3.80	9.18

These figures, when compared with the previous half-year's values show a decrease of 14.2% in areas whereas in the case of numbers there is an increase of 10.3%.

The distribution of areas and numbers in five degree ranges of latitude, as obtained from the combined data is represented in diagram I. The peak of activity of areas in the northern hemisphere is centered in the latitude belt 20°—25° whereas the numbers show maximum activity in the belt 45°—50°. In the southern hemisphere there are two peaks of activity of both areas and numbers in the latitude belts 15°—20° and 50°—55°.

The monthly, quarterly and half-yearly areas, numbers, heights and extents of prominences as derived from all the available records are tabulated below

TABLE I

1961 Months	No of effective days	Areas in sq mts	Numbers	Mean daily area in sq minutes	Mean daily numbers	Mean height "	Mean extent °
July	21½	54.5	140	2.53	6.51	39.2	3.1
August	24½	98.9	189	4.04	7.71	42.1	3.6
September	21	1.7	218	4.84	10.98	39.8	3.3
October	22½	103.5	237	4.65	10.65	40.8	3.4
November	16½	65.9	179	3.99	10.85	39.5	3.1
December	29½	65.3	221	2.81	9.51	34.4	2.9
3rd Quarter	67	255.1	547	3.81	8.16	40.5	3.3
4th Quarter	62	234.7	637	3.79	10.27	38.2	3.1
2nd half year	129	489.8	1,184	3.80	9.18	39.3	3.2

The distribution of prominences about the sun's axis of rotation is given below —

1961 July—December

	East	West	Percentage East
Total areas (sq minutes)	250.0	239.8	51.1
Total numbers	594	590	50.2

#### Observations with the Hale Spectrohelioscope

Details of Doppler displacements in the H-alpha line, observed in prominences and dark markings are given below

TABLE II

	North	South	East	West	Displacement to red and violet
Displacements in darkmarkings	18	2	10	10	20
Displacements in prominences	18	9	16	11	27

*Prominences projected on the disc as dark-markings*

During the half-year under review, photographs of the sun's disc in H-alpha line were obtained at Kodaikanal on 97 days. Spectroheliograms for 65 days were obtained from the Meudon Observatory and for 21 days from the Mount Wilson Observatory. On the whole, records were available for 121 effective days.

The mean daily areas in millionths of the sun's visible hemisphere (uncorrected for foreshortening) and the mean daily numbers of the H-alpha darkmarkings as derived from the combined photographs are given below

Combined data		
	Mean daily area (Millionths of the sun's visible hemisphere)	Mean daily number
North	1962	14.55
South	1409	10.50
TOTAL	3371	25.05

On comparing with the previous half-year's values, these figures show an increase of activity, the increase being 5.9% in areas and 27.8% in numbers.

The distribution of the areas of the absorption markings in 5 degree ranges of latitude as obtained from the combined data is shown in diagram II.

There is a broad peak of activity in the northern hemisphere in the latitude belt 15°—30°.

The distribution of total areas and numbers of the dark markings east and west of the sun's axis of rotation is given below :

July—December, 1961

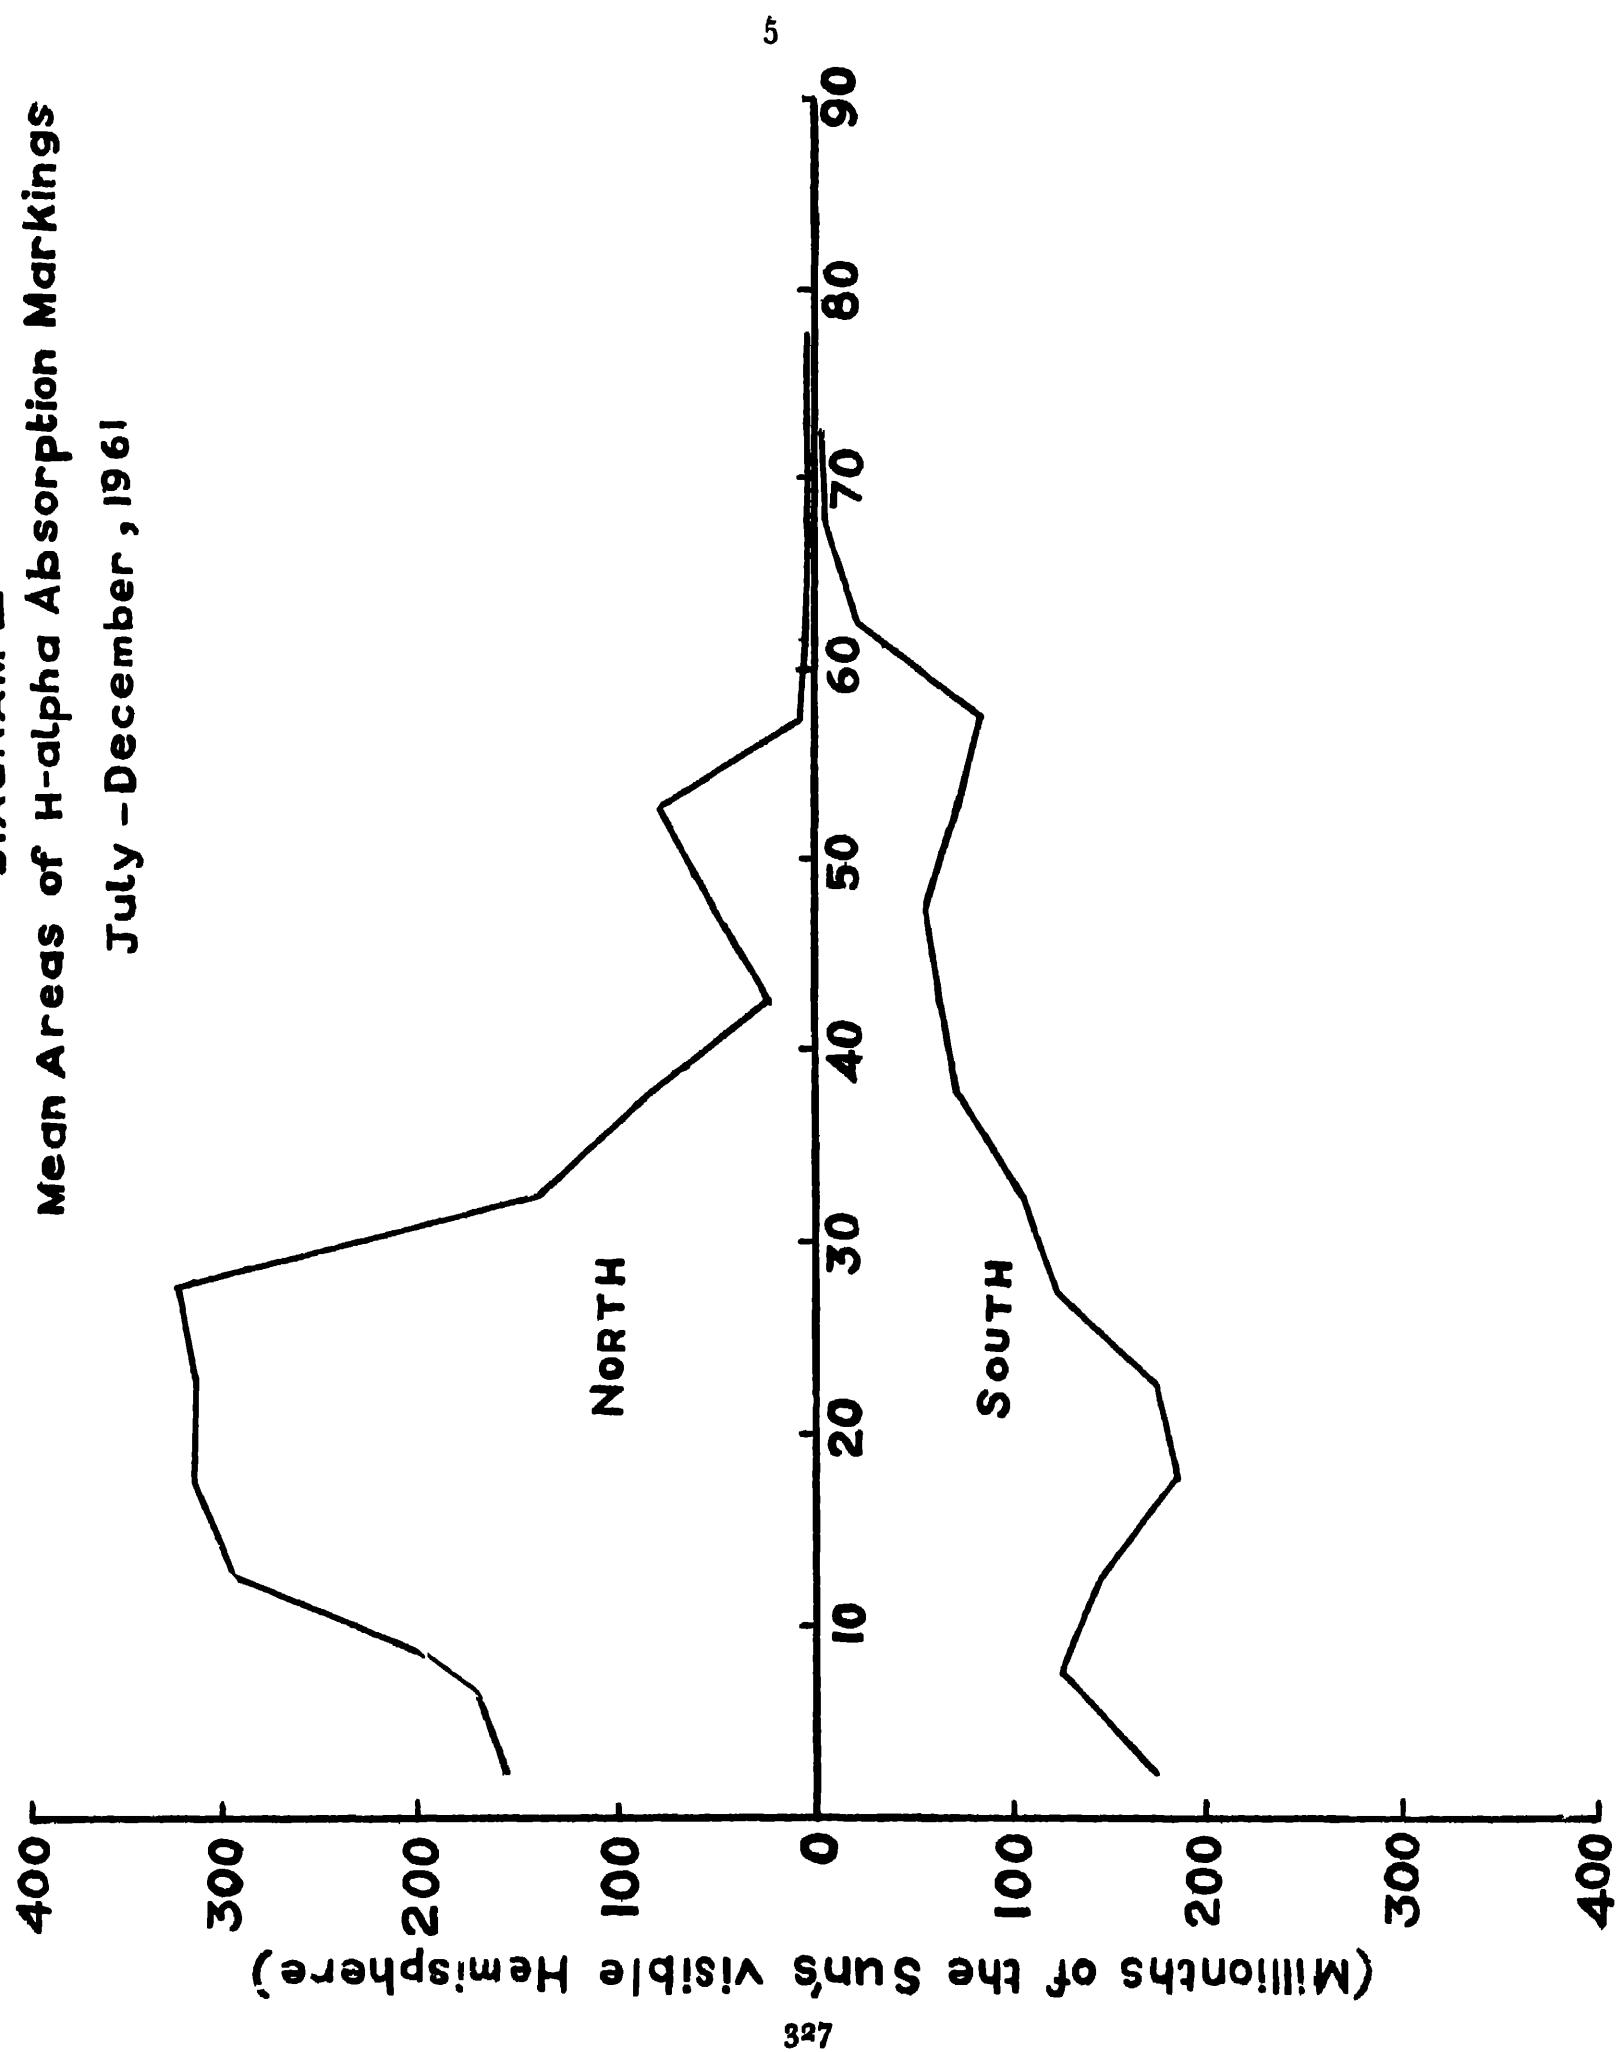

Combined data			
	East	West	Percentage East
Total area (Millionths of the sun's visible hemisphere)	2,100.81	1,978.75	51.50
Total numbers	1,503	1,528	49.58

The area shows a slight eastern increase whereas there is no appreciable difference in the numbers.

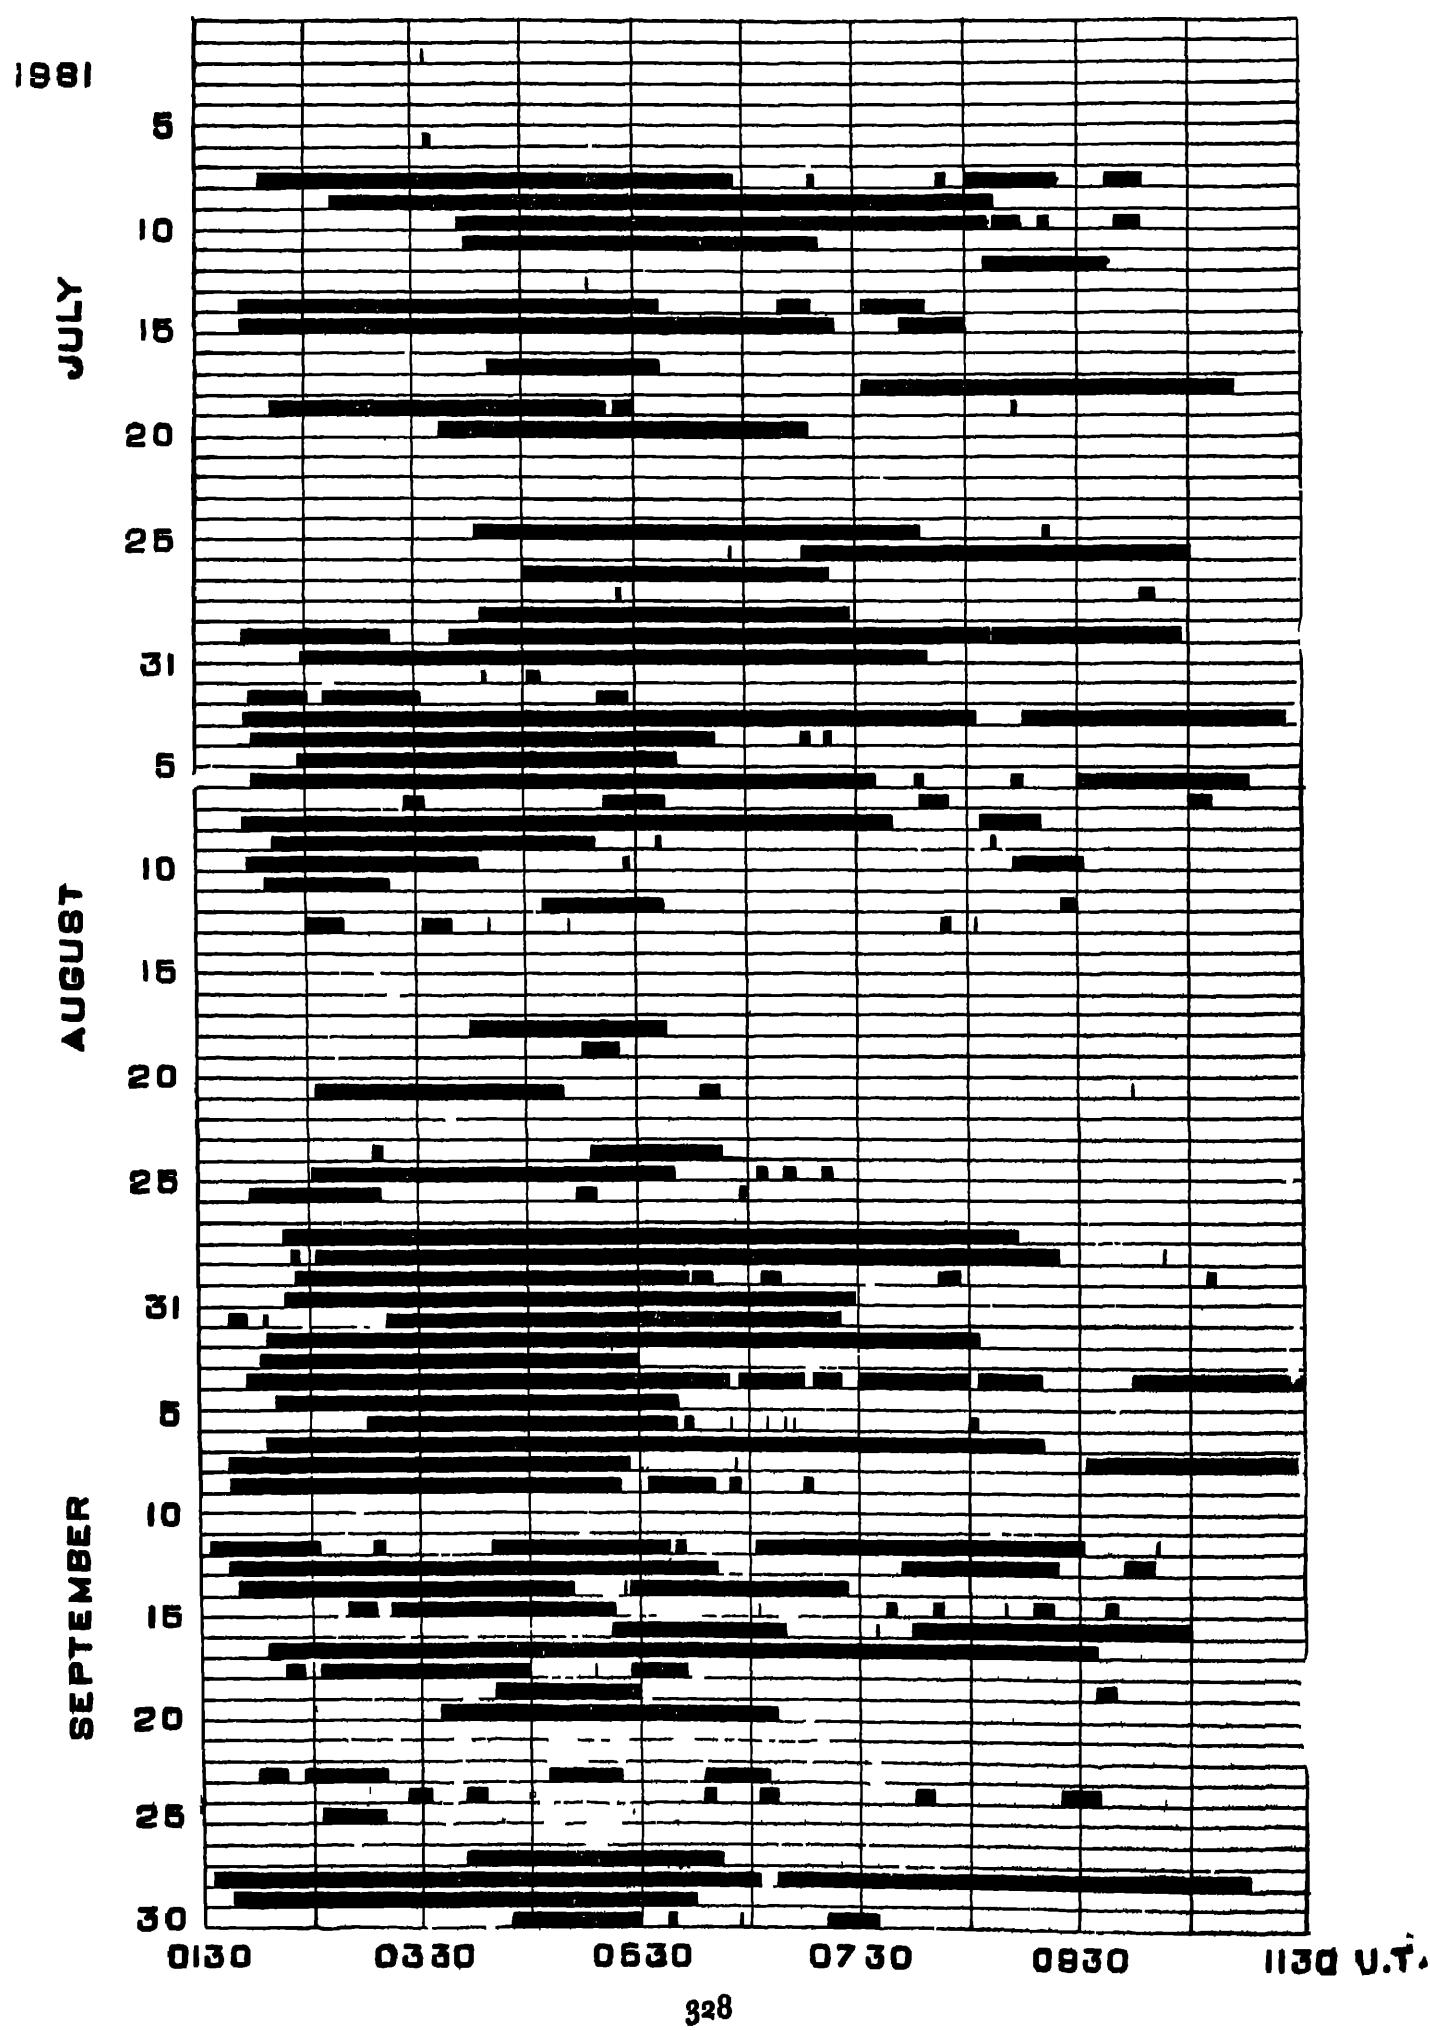

Particulars of solar flares, sudden disappearance of prominences and dark markings, surges and active prominences are given in Tables III—V.

The hours of solar patrol with the spectrohelioscope and the Lyot Filter are shown in the accompanying charts.

SPECTROHELIOSCOPE AND LYOT FILTER

*Summary of calcium flocculus observations*

During the half-year under review, calcium flocculus photographs were obtained at Kodaikanal on 133 days. Spectroheliograms for 17 days were received from the Mount Wilson Observatory and for 44 days from the Meudon Observatory. On the whole, records were available for 154 $\frac{1}{2}$  effective days.

The distribution of the areas of calcium flocculus east and west of the sun's axis of rotation is given below

July—December, 1961

	Combined data		
	East	West	Percentage East
Total area (Millionths of the sun's visible hemisphere uncorrected for foreshortening)	7,490.62	7,298.13	50.66

The mean daily area in millionths of the sun's visible hemisphere (uncorrected for foreshortening) of the calcium flocculi as derived from the combined photographs are given below

	North	South	Total
	Mean daily area (Millionths of the sun's visible hemisphere)	6,515	3,073

Compared to the previous half-year there is a slight increase in the activity, the increase being 4.67%.

## PART II

*Magnetic Observations for the Second-half of 1961*

Brief descriptions of the absolute instruments, the variometers and the system of observations are available in Bulletins Nos CXXXII and CXXXVI of this observatory. The data given in this bulletin are derived mainly from the records of La Cour instruments, but in case of failure of La Cour records, Watson magnetograms have been used.

The adopted values of the scale co-efficients for the Horizontal Force were 28r/cm from July to November, 1961 and 29r/cm for December 1961. The scale co-efficients for Vertical Force were 115r/cm for July, August and September 1961 and 120r/cm for October, November and December. The scale co-efficient for Declination was 14'/cm for the whole period.

## PART III

*Ionospheric Observations for the second half of 1961*

A description of the system of ionospheric observations at Kodaikanal with a brief description of the Ionospheric Recorder has been given in Bulletin No 146 of this observatory. The present Bulletin contains half-hourly values of eleven ionospheric parameters  $n_{eq}$ ,  $f_0F_2$ ,  $F_{01}$ ,  $f_0E$ ,  $f_0Es$ ,  $f_{bE}s$ ,  $f_{min}$ ,  $h'F_2$ ,  $h'F$ ,  $h'E$ ,  $h'Es$  and ( $M_{3000}$ )  $F_2$  with symbols and terminology as recommended by the Special Committee on World-Wide Ionospheric Soundings to the URSI/AGI in its First Report (Brussels, September 2, 1956).

## PART IV

*Observations of Solar Radio Emission*

**Introduction** Observations of solar radio emission at a frequency of 100 Mc/sec have been in progress at this observatory for some years. The radiometer consists of a drift interferometer type antenna using two stacked Yagis separated by 6 wavelengths in an east-west direction, a converter of noise factor 1.4 and a five stage broad-band I F amplifier. The bandwidth of the receiver is approximately 1.5 Mc/sec. The voltage across the detector load resistance actuates a recording milliammeter through a differential D C amplifier. The receiver is calibrated at frequent intervals with a noise generator using a CV 172 temperature limited diode.

In this bulletin all outstanding occurrences observed during the 6-month period, July-December 1961 are listed. The following symbols have been used in the tables:

- S = Simple rise and fall of intensity
- C = Complex variation of intensity
- A = Appears to be part of general activity
- D = Distinct from (e.g., apparently superimposed upon) the general activity.
- M = Two or more peaks separated by relatively long periods of quietness.
- E = Sudden commencement of activity.
- F = Multiple peaks separated by relatively short periods of quietness.

KODAIKANAL OBSERVATORY,

The following symbols and conventions have been used according to recognised practice

- (i) Approximate time of ending of storm construed as the time of cessation of reasonably marked disturbance movements in the traces.
- (ii) S.C.—Sudden commencement; (.)—Gradual commencement
- (iii) Signs of amplitudes of 'D' and 'Z' taken algebraically, (D=reckoned negative being westerly)  
(Z=reckoned positive being vertically downwards)
- (iv) Storm described by three degrees of activity, (m)—for moderate (when range is less than 250 γ)  
(mu)—for moderately severe (when range is between 251γ and 400γ)  
(s)—for severe (when range is above 400γ).
